

IMPORTANT INSTRUCTIONS

TAG-TITE[®] brand tamper evident tag retention devices securely fasten your SIS-TAG[®] and ensure adherence to management of change procedures. Each TAG-TITE cable tie features a unique serial number that can be associated to the device tag number within your CMMS to prevent unauthorized and undetected replacement of safety critical devices.

When fastening a TAG-TITE cable tie to a safety device, be sure that the cable and tag do not interfere with the operation of the safety device. Attach the cable to a manufacturer supplied tag attachment point if available.

Route the cable through the attachment point, position the tag so that it is visible and readable, and insert the free end of the cable through the open portion of the crimp until the desired length and tag position is obtained. Crimp the cable within the open portion of the crimp securely with electrician linesmen or dyke pliers. Test to ensure the cable cannot pull free of the crimp. Cut the free end of the cable flush with the crimp.

Replacement TAG-TITE cable ties can be purchased at www.sis-tag.com. Each TAG-TITE cable tie has a unique serial number so if you are replacing an existing device, you must update the serial number in your CMMS accordingly.
